

# Read the published mesh. Check what the file contains.

Six retained native meshes. Two analytic solids. Independent ASCII parsing, oriented volumes and boundary incidence without importing Gmsh.

| Reference          | Elements  | Volume error          | Solid / boundary Euler |
|--------------------|-----------|-----------------------|------------------------|
| Box                | 643-5,033 | 0% at shown precision | 1 / 2                  |
| Through-hole plate | 736-4,838 | 0.154483-0.526629%    | 0 / 0                  |

## What was checked

All 16 original artifact hashes remain unchanged. Each mesh has one volume component and one boundary component; shared interior faces and boundary edges have opposite orientations. Stored surface triangles equal the boundary derived from tetrahedra.

## What the result does not establish

Euler counts and incidence checks do not prove embeddedness, vertex-link manifoldness or exact CAD equivalence. No industrial corpus, solver convergence, structural-safety or learned-model result is claimed.

10-minute talk: failure mode (1.5 min), reference parts and hashes (2 min), determinant/incidence checks (3 min), six-case results (2 min), limits and reuse (1.5 min). IMR provides a further 5 minutes for questions. Author approval and registration remain separate from this prepared material.
